*Find the right product level for your needs*

Project teams and their requirements can change. To conquer common or complex geotechnical challenges with confidence, you need to use the appropriate capabilities that meet your current needs.

**PLAXIS** is a user-friendly, finite element package with trusted computation that is used by geotechnical engineers worldwide. We offer three flexible options, each tailored to the different geotechnical analysis needs of any firm.

**PLAXIS 2D** offers all the essential functionalities to perform everyday deformation and safety analysis for soil and rock that do not require the consideration of creep, steady state groundwater or thermal flow, consolidation analysis, or any time-dependent effects.

**PLAXIS 2D Advanced** enhances your geotechnical design capabilities with more advanced features and material models to consider creep, flow-deformation coupling through consolidation analysis and steady state groundwater or heat flow. It also solves your problems faster than PLAXIS 2D with the multicore solver.

**PLAXIS 2D Ultimate** augments the most comprehensive functionality to deal with the most challenging geotechnical projects. Options offered can help you analyze the effects of vibrations in the soil, such as earthquake and traffic loads; simulate complex hydrological ...time-dependent variations of water levels, or flow functions on model or soil boundaries, and assess the effect of transient heat flow on the hydraulic and mechanical behavior of soil.
