## Find the right product level for your needs

Project teams and their requirements can change. To conquer common or complex geotechnical challenges with confidence, you need to use the appropriate capabilities that meet your current needs.

PLAXIS 3D is a user-friendly, finite element package with trusted computation that is used by geotechnical engineers worldwide. We offer three flexible options, each tailored to the different geotechnical analysis needs of any firm:

- **PLAXIS 3D** offers all the essential functionality to perform everyday deformation and safety analysis for soil and rock, which do not require the consideration of creep, steady state groundwater, consolidation analysis, or any time-dependent effects.
- **PLAXIS 3D Advanced** enhances your geotechnical design capabilities with more advanced features and material models to consider creep or flow-deformation coupling through consolidation analysis. It also solves your problems faster than PLAXIS 3D with the multicore solver.
- **PLAXIS 3D Ultimate** augments the most comprehensive functionality to deal with the most challenging geotechnical projects. The former products 3D PlaxFlow Module and 3D Dynamics Module are included in PLAXIS 3D Ultimate. You can analyze the effects of vibrations in the soil, like earthquakes and moving traffic loads. You can also simulate complex hydrological conditions through time-dependent variations of water levels or flow functions on flow functions on model boundaries, as well as soil boundaries.
