

Bentley Communications PowerView

Network Intelligence and Data Collection for Disconnected Field Personnel

Bentley Communications PowerView enables service providers to increase profitability and customer satisfaction by empowering field personnel with the intelligence to be more productive. Unlike paper maps that become out of date and applications that depend on unreliable network connections, Bentley Communications PowerView ensures technicians, inspectors, cable locators, and first responders always have accurate network information.

Integrated Modeling and Documentation Workflows

Bentley Expert Designer Communications provides a common environment for comprehensive project delivery and connects users, projects, and your enterprise. You now have a personal portal to access learning, communities, and project information. You can also share personal files including i-models and PDFs directly from your desktop with other users, or stage them for easy access from a Bentley app, such as Bentley Map Mobile. With the new project portal, your project teams can review project details and status, and gain visibility into project performance.

Disconnected Workflows for Assured Access

A customizable, mobile environment enables search and review of device and equipment data without requiring a database server connection or local database on the field computer. This ensures network information and reporting is always available, even in wireless dead zones and disaster locations.

Inside Plant Review for Rack and Wire Data

Rack displays and wire runs provide technicians with detailed information on facility equipment. Rack data includes rack ID, equipment type, rack weight, powering, and HVAC. Wire runs document the connections and functions of each wire.

GIS-based User Interface for Rapid Access to Network Intelligence

A map interface allows field personnel to pan and zoom to any portion of the network without the difficulty of managing and retrieving separate files. Fiber, coaxial, and copper network data, whether aerial strand, underground trench, direct buried, or conduit in duct can all be displayed on one map.

Powerful Search Capabilities for Quick Location of Job Sites, Facilities, and Devices

Searching by address enables technicians to zoom the map to a job site and access records for all the devices and facilities at that location. Searching by full or partial name or ID rapidly returns information about any device or facility in the network. Additional search capabilities, including by customer, optical system circuit, or fiber outage, are also available.

Integrated Imagery for Increased Job Site Intelligence

Network maps can be overlaid with georeferenced imagery that helps field personnel locate work sites, plan jobs, and add context to redlines. High performance binary and continuous-tone raster display ensures fast application response.

Integrated imagery helps technicians plan work and interpret network maps.

Review Equipment for Details on Active Devices

Using the map view, field personnel can select any active device to review critical data such as signal level, power, voltage, and plug-in component information. XML Feature Modeling (XFM) combines equipment data and graphical information to provide intelligence that is unavailable from paper maps.

Butterfly Diagrams for Enclosure Layout Review

When servicing manholes, vaults, and enclosures, technicians can quickly review the detailed butterfly diagram of the facility. Details of the duct and cable layout as well as a list of where each fiber terminates allows rapid cable identification and faster work execution.

Splicing Diagram for Accelerated Cable Repair

Detailed diagrams of any splice enclosure provide the critical information technicians need to efficiently repair cables. All connection information, termination points, splices, fibers, buffers, and cables are displayed in an intuitive graphical format.

Cross-sections for Rapid Fiber Review

Cable cross-section views allow individual fibers to be traced by their buffer color to display connections, circuit connectivity, and working status. This lets technicians accurately identify spare fiber and complete cable work efficiently.

Duct Review for Rapid Cable and Conduit Interrogation

Color scaled cross-section views depict all the cables or conduits in a duct as well as cable and conduit ownership and leasing information. Selecting any individual cable provides technicians with detailed information, empowering them to make better-informed decisions.

Redlining for Increased Network Model Accuracy

Field personnel can use an overlay file to add notes, record actions, and depict as-built information on digital maps and diagrams. Redlines can be returned to engineering and mapping departments for increased network model accuracy. This enables fewer errors in design procedures and enterprise workflows.
